

ADULT Unfractionated Heparin Infusion – Administration page. Hospital.....Ward.....

Affix patient identification label

Preparation:

Draw up unfractionated heparin to give a **final concentration of 1000 units/ml** (e.g. Pump-Hep 20,000units in 20mls) into a luer-lock syringe.

How to sample APTT?

Sample whilst infusion is running, from another limb. If you cannot avoid taking the sample from the infusion arm, stop the infusion for 3-5mins then sample, ideally distal to the infusion site. Delay beyond 5mins of stopping the infusion will give a falsely low APTT result.

For guidance regarding patient haemorrhage, see overleaf

[illegible]

UFH Must also be prescribed on regular drug chart. Consider using LMWH where possible.

.....

Seek specialist haematology advice on loading and maintenance dose for patients $\leq 50\text{kg}$ or $\geq 100\text{kg}$

0.25mg per 100 units heparin

Time elapsed since Heparin stopped	Protamine dose required (MAX DOSE 50mg protamine)
≤ 15mins	1mg per 100 units heparin
>15mins, <2hrs	0.5 mg per 100 units heparin
≥2hrs	0.25mg per 100 units heparin
