Emergency Decision Unit Pathway

**Acute Urinary Retention
in Male Patients**

Date **DD/MM/YY**

Inclusion criteria	- Male - Acute Urinary Retention and Residual Volume <1200ml - Successful Catheterisation in the ED - Awaiting U&Es/ Catheter Care - Expected Discharge within 24 hrs
Exclusion criteria	- Unable to catheterise in the ED - Ongoing frank haematuria/ requiring irrigation - Acute Kidney Injury (if U&E's available) or Hyperkalaemia on VBG - Signs of systemic infection or other medical condition requiring inpatient management - Urinary retention post trauma - New focal neurological signs or suspicion of cauda equina.

This pathway is for MALE patients presenting with acute urinary retention. It is to allow patients to be observed post catheterisation and to standardise discharge arrangements. (see flowchart overleaf). Patients can be managed in a chair if appropriate.

EDU Plan

Refer to Urology SHO (via switchboard) for inpatient management if:

- Acute Kidney injury on U&E's
- Urine Output >200mls/ hr (monitor for at least 3 hours post catheter)

Discharge checklist	Signature/ Name
Bloods (Including U&E's) reviewed and documented in the notes	
Residual Volume Recorded in the notes.	
Urine dip sent and if evidence of infection antibiotics commenced + TTO (see antimicrobial guideline on insight for up to date prescribing advice)	
Trial Without Catheter (TWOC) arranged – either via ICE or via Spa. When asked please select patient has not seen a urologist.	
Catheter care explained to the patient/ carer and appropriate supplies provided.	
Cause of retention considered - If BPH discharge with Tamsulosin TTO - or if constipation discharge with laxatives.
